ABSTRACT

Converting a computer user interface panel between different panel types. An automated process is activated that reads field attributes of a first panel in a computer system. A configuration table associated with the first panel is tied to logic that specifies how the panel of the first type interacts with a backend of the computer system. Entries are created in a second configuration table that can be used to display a second panel in the computer system. The second panel comprises at least some of the plurality of fields and belongs to a second type of panels in which a panel of the second type is formed of configuration table entries and is independent of the backend. The automated process converts the field attributes to be compatible with the second type of panels and stores them in the second configuration table for use in displaying the second panel.
